

## CSE 3902 – Team 4 Reflection

MWF 12:40pm - 1:35pm

### Sprint 3

This team did a lot better this sprint than the last sprint, since the project was able to be tested by everyone and communication and collaboration greatly improved. The main tasks were not completed until pretty late, as seen in the burndown chart on the following page, so we still have to stay on top everything early; however, we were able to complete many subtasks pretty early, and these are not displayed in the chart.

One thing that slowed us down was the time we spent to fix our major bugs from the previous sprint. This was necessary, however, and it gave us some more experience and time to work together before jumping into sprint 3.

What we need to improve on would be our time management, planning, and communication. Most of us didn't finish our parts until pretty close to the deadline, which made it hard to debug much until the day the sprint was due. Further, we're still struggling with deciding who should do which parts of the implementation when, since none of us have much experience with projects like this. We are definitely making progress, though, as seen by the increase in quality from sprint 2 to sprint 3. Lastly, we need to find a way to better communicate, since we had some issues knowing who was tasked with aspects of the sprint. I think we should try to push for more time working in the same room, so we can ask each other questions and figure out problems together while actively implementing the code.

In the end, I believe that this team is making a bunch of progress but still needs to keep working on several aspects to reach greater efficiency and quality.
